

Circuit Description

1.RECEIVER

The signal from the antenna is passed through a transmission/reception selector circuit and is amplified by T217. The signal after amplified enter to 1846 for processing then output the audio, the audio signal is amplified by UTC2822 and output by the speaker at last.

Figure1. RECEIVER CIRCUIT

2.TRANSMITTER

The signal from the microphone passes through 1846, after modulation in the carrier modulation, the modulation signal with the carrier promotes by buffer T111、T121、T131 and amplified by T141 then sends to the antenna terminals.

Figure2.TRANSMITTER CIRCUIT

3.TRANSMISSION /RECEPTION SELECTOR CIRCUIT

The transmission output is passed through the transmission/reception selector circuit and low-pass filter to the antenna. The transmission/reception selector circuit, which consists of diodes D161, D160, D261 and D262, is turned on during transmission and off during reception to switch the signal.

4.DIGITAL CONTROL CIRCUIT

SIDE KEY AND ENCODER CIRCUIT

The signal from side key and encoder is directly input to the processor.

Reset and backup circuit

When turn on the power, a positive pulse is output from the reset circuit consisting of U821 、 D821 and R821to the 64feed of reset terminal on U821 microprocessor. When turn off the power, MCU detects a 3.3 V drop, and output a low signal, it outputs data to U898 and enter backup mode.

Figure3, digital control circuit

BATTERY VOLTAGE TEST CIRCUIT

Power supply voltage after partial pressure input to the microprocessor analog interface

BATTERY SAVE CIRCUIT

The squelch is off during receive. The power circuit enters battery save mode if no key has been pressed for five seconds.

The circuit is controlled by microprocessor directly.

5.1846 DESCRIPTION

MAINLY SECTION DESCRIPTION

1.DSP consists of IF amplifier, FM modulation, RSSI calculator, AFC control circuit, audio/audio mixer filter, CTCSS/DCS filter and so on.

2.Synthesizer mainly functions :

- ① The synthesizer produces a local oscillator signal, used to switch the RF input to a continuous low medium frequency.
- ② Synthesizer provides the base clock to adjust the VCO frequency.

3.BASE CLOCK

1846 ports more base clocks, for example, 12.8 MHz,13MHz and so on.

4.SERIAL CONTROL INTERFACE

A three lines serial control interface is used to read the main IC and 1846 control record. Serial control is 24 characters in length, 18 bit numeric string and 6 bit address string.

SPECIFICATION

Frequency Range	400-470MHz
Channel Number	16
Channel Step	12.5KHz
Antenna Impedance	50Ω
Microphone Impedance	2KΩ
work voltage	7.4V DC
Frequency Stability	$\pm 2.5 \times 10^{-6}$ ppm
Transmitter	
carrier output power	$\leq 5W$
modulation sensitivity	8-12mV
Modulation Distortion	$\leq 5\%$
Modulation Limited	$\leq 5KHz$
Adjacent Channel Power	$\geq 65dB$
Intermodulation Rejection	$\geq 40dB$
RECEIVER	
Sensitivity	$\leq 0.224\mu V$
Audio Distortion	$\leq 5\%$
SN RATE	≤ -40
Co-Channel Rejection	$\geq -8dB$
Blocking	$\geq 85dB$
Adjacent Channel Selectivity	$\geq 55dB$
Spurious Radiation	$\geq 55dB$
